

# MCP PlayGround

## 1. JIRA MCP

The screenshot displays the MCP Playground interface in a web browser. The main panel shows the configuration for the JIRA MCP, including a list of providers (Jira, MongoDB, Postman) and their connection status. The Jira MCP is selected, and its configuration is shown, including a prompt to display user stories for a specific sprint. The response area shows a list of user stories for sprint 1.

On the right, a network request for `jira_get_stories` is shown. The request is a GET request to `https://api.atlassian.com/rest/api/3/sprint/1` with a token of `OWONV2k_vR2o`. The response is a JSON array of user stories.

The screenshot displays the MCP Playground interface in a web browser. The main panel shows the configuration for the JIRA MCP, including a list of providers (Jira, MongoDB, Postman) and their connection status. The Jira MCP is selected, and its configuration is shown, including a prompt to display user stories for a specific sprint. The response area shows a list of user stories for sprint 1.

On the right, a network request for `jira_get_stories` is shown. The request is a GET request to `https://api.atlassian.com/rest/api/3/sprint/1` with a token of `OWONV2k_vR2o`. The response is a JSON array of user stories.

## 2. MONGO (LOCAL STUDIO)

[illegible]

The screenshot displays the MCP Playground web application on a local host (localhost:5173). The application is titled "MCP Playground" and includes a subtitle "Compare Local MCP and Remote MCP across Jira, MongoDB, and Postman." It features several sections:

- Model Provider:** Options for Grog and OpenAI.
- Jira MCP:** Options for Local STDIO and Remote HTTP.
- MongoDB MCP:** Option for Local STDIO.
- Postman MCP:** Options for Local STDIO and Remote HTTP.
- Connection Visualization:** A diagram showing the flow from the user to the MCP Connection Manager, which then connects to the respective MCP (Jira, MongoDB, or Postman).
- Local vs Remote MCP:** A table comparing the two approaches.

The "Prompt" section shows a request to "Display all the DB names in MongoDB" with a "Send" button. The "Response" section displays the result: "The database names in MongoDB are: 1. db\_testcase 2. admin 3. config 4. local".

The "Tool Trace Timeline" section shows a single request: "1 mongo\_get\_databases: mongo: localhost -> success - 2ms".

The "Error Simulation" section shows a message: "Five known-bad requests at the real backend to see how each error is handled." with a "Run scenario" button.

The "Local vs Remote MCP" table compares the two approaches:

|                   | Local STDIO                        | Remote HTTP                                              |
|-------------------|------------------------------------|----------------------------------------------------------|
| Transport         | STDIO (stdin/stdout)               | Streamable HTTP                                          |
| Process lifecycle | Spawned and killed by this backend | Started/Stopped independently outside this app           |
| Where it runs     | Same machine, child process        | Any reachable host (can be same machine, different port) |
| Auth              | Inherits this                      | Bearer token over                                        |

The Chrome DevTools Network tab shows a request to "chat" with a response containing the following JSON:

```
{
  "success": true,
  "data": {
    "response": "The database names in MongoDB are:\n1. db_testcase\n2. admin\n3. config\n4. local",
    "modelProvider": "grog",
    "model": "llama-3.3-70b-versatile",
    "toolTrace": [
      {
        "system": "mongo",
        "connectionMode": "local",
        "transport": "stdio",
        "tool": "mongo_get_databases",
        "input": {},
        "status": "success",
        "durationMs": 2
      }
    ],
    "tool Rounds": 1,
    "stopReason": "no_tool_calls",
    "durationMs": 698
  }
}
```

Prompt

remain consistently high, \"context\": \"\". \"hypertension, also called high blood pressure, is a chronic medical condition where the force of blood against artery walls remains elevated over time. This indicates a high level of faithfulness in the response.

Send

Response

The evaluation of faithfulness for the response to the query \"What is hypertension?\" is 100%. The response accurately defines hypertension as a condition where blood pressure remains consistently high, aligning perfectly with the provided context describing hypertension as a chronic medical condition where the force of blood against artery walls remains elevated over time. This indicates a high level of faithfulness in the response.
